INFO1005 WEBSITE DESIGN · ASSESSMENT 1

HTML Validation and Problem Solving

Arnold Scenario 2: fixing the errors in Arnold Schwarzenegger's website

Group 5 *Student ID 22255923* *23/10/2026*

Group 5

Team members (subject to change)

Rafael Dela Cruz	*Abuk Akol*	*Koby Duarte*
Jessica Gonzales	*Daniel Hanna*	*Siawash Najibi*

What the assessment covers

Inspect

Review the three HTML files for structural problems

Correct

Fix tags, headings and character encoding

Validate

Recheck every file with the W3C HTML Validator

Explain

Cover index.html, plain-text files and hyperlinks

Initial validation results

`index.html`

4

errors found

`stuff.html`

24

errors found

`TWINS.html`

2

errors found

The errors fell into three groups: unmatched or misplaced tags, a broken heading structure, and a missing DOCTYPE with character-encoding problems.

index.html: four errors, four fixes

Issue	*Correction*	*Reason*
*Unmatched *	*Added the missing opening *	*Gives the paragraph a valid start and end*
Paragraph inside <h3>	*Added </h3> after “Acting career”*	*Separates the heading from the paragraph*
Heading nested inside another heading	*Corrected the missing heading closure*	*Restores proper HTML structure*
<h3> followed by <h6>	*Changed <h6> to <h4>*	*Keeps a logical heading hierarchy*

✓ *Revalidated with the W3C HTML Validator: no errors or warnings*

stuff.html: 24 errors, five causes

Error numbers	*Problem*	*What needed to happen*
1–4, 6–11, 16, 18–19	*Malformed byte sequences*	*Fix the text encoding and check the affected characters*
5	*Missing DOCTYPE*	*Add <!DOCTYPE html> at the very beginning*
12–15, 21–22, 24	*Heading <h3> not properly closed*	*Find the opening <h3> on line 19 and close it correctly*
20	*Extra </p> or badly structured paragraph*	*Match the paragraph opening and closing tags*
23	*Unclosed HTML elements*	*Close the elements before </body>*

stuff.html: 24 errors down to zero

BEFORE

24

Original file, as first validated

AFTER ENCODING FIX

10

Saved as UTF-8, malformed bytes gone

FINAL CHECK

0

DOCTYPE added, headings and paragraphs repaired

Fixing the encoding came first because it cleared more than half of the errors. The remaining structure errors were then fixed and the file was revalidated.

TWINS.html: two stray closing tags

Error	Fix applied	Reason
Stray closing </h2> (error 1)	Corrected the heading markup around “Review”	Heading has a matching opening and closing tag
Stray closing </h2> (error 2)	Replaced the extra closing tags with Review	Removes invalid tags and improves structure

BEFORE

```
</h2>Review</h2>
```

AFTER

```
<h2>Review</h2>
```

REVALIDATED

No errors or warnings

Results across all three files

Errors on first validation, and after correction

All three files now pass the W3C HTML Validator

Why the homepage is named index.html

STEP 1

A visitor opens the site address

STEP 2

The server looks for index.html

STEP 3

The homepage opens automatically

Web servers treat index.html as the default page for a site's main directory, so visitors never have to type the filename. Names such as home.html or arnold.html would also work, but index.html is the widely used convention.

Why save Word content as .txt first

WORD DOCUMENT

Carries fonts, colours, styling and hidden code

PLAIN .TXT FILE

Keeps only the text, with no extra formatting

HTML FILE

Headings, paragraphs and links added with tags

Plain text is easier to copy into an HTML file without bringing unwanted formatting or hidden code across. The content is then formatted properly with HTML tags.

Hyperlinks acknowledge original sources

The anchor tag creates a clickable link, and its href attribute holds the address of the original source.

Readers can follow the link to find the information, and the original writers receive credit.

EXAMPLE

```
<a href="https://www.example.com">
  Original source
</a>
```

SHOWN IN THE BROWSER AS

Original source

Replace the example URL with the actual website address.

Conclusion

01 *index.html, stuff.html and TWINS.html were corrected and now pass the W3C HTML Validator with no errors.*

02 *index.html is the standard homepage name, plain text avoids unwanted Word formatting, and hyperlinks credit original sources.*

03 *The task built our skills in spotting coding problems, validating web pages and documenting changes as a team.*
